B2B-API-010 - B2B Ecosystem Integration: From Customer	

1. Introduction

This document defines the structured set of **business scenarios that tenderers are required to demonstrate as part of the BSS** (Business Support System) solution evaluation process in the **second round**. It serves as the primary reference guide for both the tenderer demonstration teams and the evaluation committee throughout the selection procedure.

The scenario collection is organized into four principal domains:

- **Business-to-Consumer (B2C)** scenarios covering consumer product configuration, customer acquisition, self-service, order fulfilment.
- **Business-to-Business (B2B)** scenarios covering enterprise product configuration, customer segmentation and lifecycle management, guided lead-to-order sales, legal entity onboarding, service change handling and commission management.
- **API scenarios** validating that key B2C and B2B processes can be fully executed through TM Forum Open API calls, independently of the graphical user interface (demonstration in the second round).

Each scenario in this collection is classified according to one of three demonstration types. These types reflect the nature of what is being shown and the evaluation criteria applied:

Configuration - demonstrates the setup and parameterization of products, plans, pricing

rules, and hierarchies within the BSS platform. These are enabler scenarios that allow the evaluation committee to observe system configuration from a user interface perspective and to confirm that the platform's data model and catalogue structures align with the LMT requirements.

System Functionality – demonstrates live end-to-end processes and workflows in a running environment. The demonstration must specifically cover key business processes such as customer engagement, lead-to-order, and order-to-delivery, problem-to-solve. This includes showcasing how the system manages initial customer interactions, captures and qualifies leads, converts leads into orders, and supports the fulfilment and delivery of products or services.

API – demonstrates how each scenario can be executed through available TM Forum Open APIs, not only through the user interface. The tenderer should use tools such as Postman, Swagger/OpenAPI, or equivalent API clients to prove that BSS capabilities are exposed as reusable, standards-based services. For each API scenario the tenderer must present relevant API calls step-by-step, including request payloads, responses, identifiers passed between systems, and status transitions. The demonstration must also show how the APIs support orchestration, validation, order progression, and error handling, enabling the evaluation committee to assess the platform from an integration and architecture perspective.

1.1 Solution demonstration organization

The solution demonstrations are structured as half-day sessions with demonstrations on-line via MS Teams link. Tenderers are expected to follow the proposed agenda and comply with the instructions for moderating questions and answers.

The indicative agenda for **second round** is set out below:

Extended B2C scenarios and API B2C scenario with Q&A	~ 2 h
Break	~ 15 minutes
Extended B2B scenarios and API B2B scenario with Q&A	~ 2h

Tenderers should plan their preparation accordingly and ensure that demonstration environments are fully configured and stable ahead of the session. Tenderers are responsible for managing time across sessions. The evaluation committee reserves the right to adjust the agenda on the day to accommodate questions or to probe specific areas in greater depth. Tenderers should therefore be prepared to demonstrate any scenario on request rather than in a strictly linear sequence.

Expectations from tenderers:

- Demonstrate all scenarios defined in this document. For any scenario that cannot be fully demonstrated, provide a written explanation.
- Adapt and enhance scenarios where appropriate to showcase the solution's capabilities to the greatest advantage. Tenderers may extend or enrich scenarios to illustrate additional value, provided the core requirements of each scenario are fully addressed.
- Integrations with external systems (such as billing engines, self-service portals, or e-commerce platforms) may be simulated where a live integration is not feasible within the demonstration environment. Any simulation must be clearly identified.
- All API demonstrations must use real API calls against a live or sandboxed instance of the BSS platform.

2. Abbreviations and Terms

The following abbreviations and terms are used throughout this document.

AI	Artificial Intelligence – machine learning and intelligent automation capabilities embedded in BSS processes
API	Application Programming Interfaces - set of rules and protocols that enables different software applications to communicate and exchange data with each other.
B2B	Business-to-Business – commercial segment serving corporate and enterprise customers.
B2B2C	Business-to-Business-to-Consumer - a commercial model in which the operator partners with business customers to extend products and services directly to that business's own end users, whether employees or consumers, enabling the operator to reach and serve a broader base beyond the direct B2B relationship.

B2C	Business-to-Consumer – commercial segment serving individual and household retail customers.
BSS	Business Support Systems – the suite of software used by telecoms operators to manage customers, products, orders, billing, and revenue.
CFG	Configuration – scenario type focused on product, eligibility, rules or functionality setup within the BSS platform.
CRM	Customer Relationship Management - a system used to manage customer data, interactions, sales pipeline, and service history across all touchpoints.
E2E	End-to-End Functionality - describing a complete process or flow executed across all system components from initiation to final fulfilment without manual handoffs.
EU	European Union - used in the context of regulations and data protection legislation (e.g. EU roaming, GDPR) applicable to operators within member states.
LMT	Latvijas Mobilais Telefons Ltd. – Latvia's leading telecommunications and technology company. Around LMT, several companies were established to form the LMT group such as LMT R&L Ltd. and LMT Finance Ltd.. In this context LMT is BSS systems procurement organizer and consumer. LMT R&L Ltd. is a subsidiary of LMT Ltd., specializing in electronic device retail and repair. LMT Finance, also a subsidiary of LMT Ltd., provides and

	manages financial services for the group's customers, including installment plans for device purchases.
NBO	Next best offer – rules or AI driven capability that recommends the most relevant product, bundle, or retention offer to a customer based on their profile, behaviour, and eligibility.
NP	Number Portability - a regulatory requirement that allows a customer to keep their existing mobile or fixed telephone number when switching from one operator to another.
SIM	Subscriber Identity Module – a physical or embedded card that identifies and authenticates a mobile subscriber on a network, storing credentials and enabling service access.

SMS	Short Message Service – a text-based messaging protocol used by operators to send transactional and promotional notifications to customers via mobile network.
-----	--

3. Scenario Summary

B2C-E2E-008	E2E Functionality	Sales goal setting, assignment, and performance tracking	B2C
B2C-E2E-009	E2E Functionality	Prepaid Card Purchase and Migration to Postpaid	B2C
B2C-E2E-010	E2E Functionality	Pre-orders with Open Agreement and bulk operations	B2C
B2C-API-011	API	Non-resident customer onboarding & eSIM activation (self-service)	B2C
B2B-E2E-006	E2E Functionality	Business User Experience: Sales Team Lead & Account Manager	B2B
B2B-E2E-007	E2E Functionality	Sales Commission: Approved Deal → Commission Calculation Initiation / Handoff	B2B

CONFIDENTIAL

B2B-E2E-008	E2E Functionality	Data-Driven Campaign Management & Sales Follow-Up	B2B
B2B-E2E-009	E2E Functionality	Incident & Problem Management with AI Assisted Root Cause Analysis	B2B
B2B-API-010	API	B2B Ecosystem Integration: From Customer Onboarding to Operations	B2B

4. B2C Scenarios

B2C-E2E-008 - Sales goal setting, assignment, and performance tracking

Persona	Maris is Sales Manager of LMT's B2C retail and contact center sales team. He is responsible for setting quarterly sales targets, assigning quotas to individual agents and retail locations, monitoring real-time team performance against targets, and adjusting strategy mid-period when gaps appear. Maris relies on the BSS platform to define sales goals, distribute them across his team, and track progress through a unified sales performance dashboard. Janis is Sales Operations Analyst and supports Maris by preparing sales planning inputs, running what-if scenario models, generating performance reports, and ensuring that sales incentive rules are correctly configured in the platform and aligned with the current product strategy. Linda is a Customer Service Representative working in a retail store. She provides assistance to walk-in customers, identifies their needs and performs sales and service transactions using the BSS platform. She also has her own monthly sales target and can check her attainment against it at any time, without needing to ask her manager.
Scenario Description	This scenario demonstrates how the BSS solution supports the full cycle of B2C sales performance management — from setting sales goals at the start of a quarter, through tracking performance and adjusting course during the sales period, to calculating incentives and forecasting outcomes at the end of it. It follows two

connected threads: how targets are set and distributed before a sales period begins, and how they are tracked, managed, and rewarded while the period is active.

At the start of the quarter, **Maris**, the Sales Manager, defines the team's sales targets — broken down by product, sales channel (retail store, contact center, digital), region, and individual team member. He aligns these targets with current commercial priorities, for example giving more weight to a product the business wants to push during a campaign. Once set, the targets are distributed to each agent and store, and **Maris** can see who has acknowledged theirs.

Before targets go live, **Janis**, the Sales Operations Analyst, supports Maris by preparing the planning inputs behind them and configuring how incentives and bonuses will work — for example, tiered bonuses that unlock at different levels of target attainment, and commission rules that vary by product. Janis also builds what if scenarios, adjusting assumptions such as headcount, quota levels, or product mix, so **Maris** can see the likely impact of different choices before committing to a plan.

Once the sales period is underway, **Linda**, a Customer Service Representative in a retail store, serves walk-in customers and completes sales and service transactions as part of her normal day. Throughout the period, she can check her own progress against her personal target at any time — how many units she has sold, her attainment percentage, and where she stands on bonus eligibility — without needing to ask her manager or wait for a report. She only ever sees her own results, not those of her colleagues.

Maris monitors the team's performance as the period progresses, watching attainment roll up from individual agents to stores, channels, and the wider organization. When he spots an agent or store falling behind, he can act — reassigning part of a target, offering support, or flagging the gap — and the change is reflected immediately across dashboards, with the reason recorded and the affected agent notified.

As agents like **Linda** work through customer interactions, they log their calls, meetings, and proposals directly against each opportunity, so the platform can connect effort to results — for example, how many calls typically lead to a sale.

Throughout the period, the platform also produces revenue forecasts based on the current sales pipeline, factoring in how

	likely each open opportunity is to close and how quickly agents are moving deals forward. At the end of the period, Maris and Janis can compare what was forecast against what actually happened, to sharpen future planning. If a customer later cancels a subscription shortly after it was sold, any commission already paid on that sale is automatically clawed back and reflected in the agent's record.
Product / Bundle	Primary target bundle product for this sales period is “Unlimited”, configured in the B2C-CFG-003 scenario. Sales goal context: The Sales Manager sets the “Unlimited” mobile subscription as the primary quota-driving product for the current quarter. Targets are defined per agent, per store, and per channel against this product, with higher incentive weighting applied. Secondary quota products (for target mix completeness): • Additional mobile line add-ons (household multi-line upsell) • Next Best Offer
Business Rules	Target Setting • Sales targets must be defined at multiple levels (organization wide, channel, region, store/team, individual agent). Higher level targets must cascade consistently to lower levels without manual recalculation. • Targets are linked to product categories sourced from the Product Catalog. • A target period must have a defined start and end date; targets cannot be modified retroactively once the period is active without an authorized change request and audit trail. • Target redistribution mid-period is permitted only by authorized Sales Manager role, with mandatory justification recorded and notification sent to affected agents Bonus rules • bonus schemes must be configured to align with product sales priorities, higher quota attainment thresholds (e.g., 90%, 100%, 110%) must unlock different bonus tiers, reflecting the sales strategy defined by the Sales Manager • Commission clawback rules apply: if a customer cancels the unlimited subscription within the retention window (e.g., 3 months), commissions linked to that sale are automatically reversed and the agent's performance record is updated accordingly

- Bonus eligibility is evaluated at period end based on final attainment against confirmed targets; partial-period agents (joiners/leavers) have pro-rated targets and bonus eligibility calculated automatically

Performance Tracking Rules

- Sales performance data must be updated in real-time or near real-time from completed order, the performance dashboard must reflect sold subscriptions, activation confirmations, and port-ins without manual data entry
- Performance metrics must be available at individual agent level and rolled up to store, channel, region, and organization level with drill-down capability from any aggregated view
- Each individual agent (for example, a Customer Service Representative such as Linda) must be able to view their own target attainment at any time without requesting a report from a manager; visibility of another agent's individual results must be restricted to authorized manager and analyst roles.
- Sales activity logging (calls, meetings, proposals) is mandatory per opportunity for effort-to-outcome metric calculation — agents must be able to log activities directly in the platform without switching to a separate CRM tool
- Forecast accuracy must be measurable: the platform must compare forecast outputs against actual at period close to enable continuous improvement of planning assumptions

Forecasting Rules

- Forecast outputs must be visible to Sales Manager and Sales Operations Analyst roles, individual agents must not have access to organizational forecast data outside their own performance view
- The platform must support pipeline-based sales forecasting that calculates projected revenue from opportunity data • What-if scenario modelling must allow the Sales Operations Analyst to adjust planning input assumptions (e.g. headcount, quota levels, product mix targets, and channel capacity) and evaluate the resulting commercial outcome before any live target is changed
- Sales velocity metrics (average deal size, win rate, sales cycle length, number of active deals) must be tracked continuously and used for capacity planning, surfacing a gap alert to the Sales Manager when projected pipeline attainment falls below a configurable threshold for the current period

Expected Outcome	• Sales targets configuration demonstrated: per product, channel, store, and individual agent, linked directly to the Product Catalog without manual data entry
-------------------------	---

	• Target assignments distributed to agents and store managers with acknowledgement tracking visible to the Sales Manager • Incentive and bonus scheme enforced automatically by the platform based on confirmed quota attainment at period end • Individual agent dashboard displays current target, units sold, attainment %, and bonus eligibility status in real time visible only to that agent and not to colleagues. • Sales Manager dashboard shows team attainment, store rankings, underperforming agents flagged with gap-to-target, and forecast vs. target • Mid-period target adjustment applied immediately across all dashboards with justification recorded and agent notified automatically • Sales activities logged against customer interactions with effort-to-outcome metrics visible in the Sales Manager view • What-if scenario model generates a revised revenue forecast from adjusted planning assumptions without affecting live targets • Pipeline forecast produced showing expected subscription revenue weighted by sales stage probability and agent activity velocity • Commission clawback triggered automatically on customer cancellation within the retention window with full audit trail
Business Value	• Reduces manual sales planning effort through automated target cascading, quota distribution, and incentive calculation • Improves sales performance visibility with real-time dashboards across agents, stores, and channels • Enables data-driven quota planning and forecasting • Increases sales efficiency through effort-to-outcome metrics that guide agents toward high-converting activities • Supports faster and more accurate mid-period decisions through pipeline-based forecasting and what-if scenario modelling • Reduces commission processing errors

Needed Entities	• Sales target and quota management • Product catalog (consumed for quota definition and product priority weighting) • Sales performance dashboard (agent view and manager view) • Incentive and bonus scheme configuration • Commission Management (per-product commission, clawback rules, audit trail)
------------------------	---

	• Sales activity log (calls, meetings, proposals, follow-ups) • Pipeline-based forecasting engine (stage weighting, velocity metrics, capacity planning) • Order management (feeds real-time sales performance counters) • Notification service (target assignment, acknowledgements, mid-period changes, period-close alerts) • Role-based access control (agent, manager, analyst views)
--	---

B2C-E2E-009 - Prepaid Card Purchase and Migration to Postpaid

Type: E2E Functionality Segment: B2C	
Persona	Linda is a Customer Service Representative working in a retail store. She provides assistance to walk-in customers, identifies their needs and performs sales and service transactions using the BSS platform.

Scenario Description	This scenario demonstrates how the BSS platform supports interconnected B2C commercial journeys within a single demonstration flow: 1) prepaid card purchase and activation, 2) migration of an existing prepaid customer to a postpaid subscription retaining the same number throughout. The demonstration should cover: • Prepaid activation – customer Janis visits an LMT retail store and purchases an LMT Karte prepaid SIM. His identity is verified, a customer record is created, the SIM is issued, and the prepaid account is activated with an initial top-up balance. • Bundle activation - A bundle is applied to his prepaid account, and the subscription terms are confirmed. • Migration to postpaid - An existing prepaid customer is migrated to a postpaid plan. This includes closing the prepaid account, transferring the number, creating a billing account, and sending a confirmation notification. • Customer 360 view - The customer profile is visible in Customer 360 view first as a new prepaid customer and later as a migrated postpaid customer, showing full account history, subscription status, and billing details.
Product / Bundle	Bundle name: LMT Karte Includes:

	• Physical SIM card or eSIM (customer's choice) • unlimited calls and unlimited internet in Latvia for 7 days • No contract, no identity-linked billing account required for basic activation • Top-up via bank transfer, online payment, or cash at retail Pricing: • Initial balance loaded upon purchase (e.g., 4.99 € — Week for All bundle) For Postpaid product – choose any from 1st round scenarios.
--	---

Business Rules	Prepaid Card Purchase & Activation • A new prepaid customer record must be created with minimal mandatory data - name and identity document are required for regulatory compliance; a full postpaid profile with billing account is not required at prepaid activation stage. • Physical SIM and eSIM must both be supported as delivery options within the same order flow, the Sales agent selects the SIM type and the platform allocates a resource (MSISDN + ICCID or EID) from the available inventory. • The initial balance or bundle must be applied to the prepaid account immediately upon payment confirmation, the customer's service must be active within the same retail session. • Prepaid bundle subscriptions (e.g., Week for All, Month for All) must be applicable to the prepaid account via a single agent action without requiring a separate order or manual provisioning step. • The prepaid account must be visible in the Customer 360 view from the moment of activation - showing current balance, active bundle, expiry date, and MSISDN. Prepaid-to-Postpaid Migration • Migration from prepaid to postpaid must be initiated for an existing LMT prepaid customer without requiring the customer to create a new account - the existing party record, MSISDN, and interaction history must be carried over to the postpaid subscription. Additional customer information is requested for postpaid services. • Any unused prepaid balance at the time of migration must be handled according to a configurable business rule, options include transfer as a credit to the first postpaid invoice, forfeit after a defined grace period, or refund.
-----------------------	--

	• The postpaid billing account must be created as part of the migration order and linked to the customer's party record, credit eligibility validation must be triggered automatically as part of the order flow. • The prepaid account must be closed and the MSISDN released to the postpaid subscription upon confirmed activation, the platform must prevent the same number from being active on both account types simultaneously at any point. • The full migration journey from prepaid closure through postpaid activation must be tracked as a single order lifecycle event, with each state transition visible in the order management view and in the Customer 360 view.
Expected Outcome	• Demonstrated creation of a new prepaid customer record with SIM or eSIM issuance, MSISDN allocation, and bundle activation within a single retail session • Prepaid account visible in Customer 360 view immediately after activation • Platform demonstrates prepaid-to-postpaid migration order flow - existing party record, MSISDN, and interaction history carried over without creating a new customer account • Postpaid subscription activation is demonstrated as the final migration step - prepaid account closed and MSISDN transferred to the postpaid subscription in a single orchestrated flow • Billing account creation and credit eligibility validation are demonstrated as automated steps within the migration order flow • Unused prepaid balance handled according to the configured migration rule • Customer 360 view demonstrates the complete lifecycle - prepaid account history, migration event, and active postpaid subscription visible in a unified customer profile
Business Value	• Customer acquisition through a frictionless prepaid entry path - customers can become LMT subscribers immediately, without a contract or credit check, lowering the barrier to entry • Converts prepaid customers to higher-value postpaid subscribers • Reduces manual processing in prepaid-to-postpaid migration and subscription activation eliminate back-office steps and reduce processing errors • Provides a complete customer view across the full prepaid and postpaid lifecycle

	• Provides a single source of truth for all customer-related documents and interactions
Needed Entities	• Customer (individual and household account) • Customer 360 view • Product catalog (bundle, components, pricing) • Order management • Agreement and contract management • Pricing and discount rules (partnership-based discounts) • Consent management • Billing account created upon postpaid activation, linked to customer party record, credit eligibility validation • Balance migration rule configuration per business policy • Document management system (with OCR and external integration) – for preview purposes • Payment and billing entities (installments, recurring charges) - for preview purposes • Integration layer (for third-party document scanning tools) - for preview purposes

B2C-E2E-010 - Pre-orders with Open agreement and bulk operations

Type: E2E Functionality Segment: B2C	
Persona	Roberts is an existing LMT customer with an active <u>Open Agreement</u> on an iPhone 17 Pro. He has been paying his monthly device subscription for over nine months and, now that the iPhone 18 has launched, wants to exchange his current phone for the newest model. Linda is a Customer Service Representative working in a retail store. She serves walk-in customers, and during the iPhone 18 launch period she handles a high volume of pre-order pickups and device exchanges in a short space of time. Toms is a Device Evaluation Technician at R&L Ltd. device returns and refurbishment centre. He inspects exchanged devices, decides whether each one is fit to be resold as used equipment, and assigns it a value classification based on its condition. Kristaps is a Retail Operations Manager responsible for planning and running the iPhone 18 launch across all stores — opening the pre-order window, notifying every eligible customer, allocating stock to stores based on demand, and

	making sure the surge of
--	--------------------------

	pickups and exchange on launch day can be processed smoothly rather than one customer at a time.
--	--

Scenario Description	This scenario demonstrates how the BSS solution supports a device pre-order journey for existing Open Agreement customers around a major device launch, together with the bulk operations needed to handle a sudden surge of activity across all stores on launch day. Ahead of the iPhone 18 launch, Kristaps opens a pre-order campaign for customers who already hold an Open Agreement on an eligible iPhone 17 and have completed at least nine months of their current agreement. He allocates expected stock across stores based on how many eligible customers are likely to pre order in each location. Once the eligible customer base is confirmed, Kristaps triggers a personalized email to each of them, including Roberts — rather than a single generic announcement, each email reflects the recipient's own device, device exchange eligibility, and a direct link to pre-order. Roberts receives his email, follows the link, and places a pre-order for the iPhone 18 through LMT's self-care channel, confirming that he will exchange his current iPhone 17 Pro. He is shown the new device's monthly price, and how his existing Open Agreement will be closed and replaced by a new one once the exchange is complete. On launch day, Roberts visits his local store to collect his new iPhone 18 and hand in his old device. Because many customers are doing the same thing at the same time, Linda works through a queue of pre-order pickups rather than handling each one as a fully separate, first-time transaction — the store already knows who is expected, what they ordered, and what they are exchanging. When Roberts hands over his old iPhone 17 Pro, Linda registers it against his pre-order using the device's identifier. Roberts leaves the store with his new iPhone 18 and his new Open Agreement already active — he does not have to wait for his old device to be fully evaluated. In the meantime, his previous agreement and the services tied to his old device, such as insurance, are marked for closure but not finalised yet. The returned device is sent to Toms at the returns and refurbishment centre, where he assesses its condition. If the device is suitable for resale, Toms finalises the closure of Roberts's old agreement, removes the device's link to Roberts's account, and cancels any services still attached to it. If defects are identified during Toms's evaluation, the related charges are added to the customer's monthly bill.
------------------------------------	--

	He then assigns the device a depreciation classification based on its condition, which determines its resale price and category. If a device fails the assessment — for example, due to serious damage — it is excluded from resale and sent for disposal instead. Once classified, an approved device automatically becomes available in retail stores as used stock, separate from new devices, with its condition and price visible to store staff. Because launch day produces a large number of exchanged devices and pickups at once, Kristaps and his team process pre-order fulfilment, returned devices, and device evaluation in batches rather than one device or customer at a time — while still keeping a complete, traceable record for every individual customer and device involved, even when they were handled as part of a larger batch.
Product / Bundle	Open Agreement — iPhone 18. A device subscription offer allowing a customer to use the newest iPhone for a monthly fee, with a minimum commitment period of nine months. After nine months, the customer may exchange their device for the newest model. After 24 months, the device becomes the customer's property, and no further monthly fee is due. Customers currently on an Open Agreement for an iPhone 17 or its variants (e.g., Pro, Pro Max), who have completed at least nine months of that agreement, are eligible to pre-order the iPhone 18 and exchange their current device. Used device resale: Exchanged devices that pass condition evaluation are resold through LMT retail stores as classified used equipment, at a price reflecting their assigned depreciation category.
Business Rules	Pre-order Eligibility & Campaign Setup • Only customers with an active Open Agreement on an, who have completed at least nine months of that agreement, are eligible to pre-order the iPhone 18. • Eligibility must be checked automatically against the customer's agreement and its start date; customers who do not yet qualify must be told when they will become eligible. • LMT must be able to open and close the pre-order window for a defined period, and see how many eligible customers have pre-ordered against available stock at any time. • Once the eligible customer list is confirmed, a personalized email must be sent to every eligible customer in bulk, each one reflecting that customer's own device, exchange

eligibility, and a direct link to pre-order — rather than a single generic announcement sent to everyone.

Pre-order Placement & Trade-in Commitment

- An eligible customer must be able to pre-order a specific iPhone 18 model and variant while confirming that they will return their current device.
- At the time of pre-order, the customer must be shown the new device's monthly price, and how their existing agreement will be closed and replaced.
- A customer must only be able to hold one active iPhone 18 pre-order at a time.

Bulk Fulfilment & Launch-Day Operations

- Because launch day is expected to bring a high volume of pickups and device returns at the same time, the platform must support processing pre-order fulfilment, activation, and returns in batches rather than one customer at a time only.
- Store staff must be able to see and work through a queue of expected pre-order pickups per store per day, with stock allocated to each store ahead of time based on pre-order demand.
- If demand at a store exceeds its allocated stock, this shortfall must be clearly flagged so staff can inform affected customers and offer an alternative pickup date or location.

Returns

- When a customer hands in their device, the store must be able to register the device returns against the customer's pre-order using the device's unique identifier.
- On intake, the device's link to the customer's account — including the agreement and any connected services such as insurance — must be marked for closure but not fully removed until the device's condition has been confirmed.
- The customer must receive their new iPhone 18 and start their new Open Agreement without waiting for the final condition evaluation of their returned device to complete.

Device Condition Evaluation & Depreciation Classification

- Every returned device must go through a condition evaluation before it can be resold, resulting in a decision on whether it is fit for recirculation as used equipment or must be retired.
- If a device is approved for recirculation, all remaining ties to the previous customer must be fully removed: the

	agreement, the device's link to the customer, and any attached services must be terminated. • An authorized technician must assign a depreciation classification to the device based on its condition, which determines its resale price and category as used stock. • A device that fails evaluation (for example, due to serious damage) must be excluded from resale and routed to disposal rather than being added back to stock. Relisting as Used Inventory • Once classified, an approved device must automatically appear in retail store inventory as used stock, distinct from new stock, with its condition grade and price visible to store staff. • Used devices must be sellable through the same retail channels as new stock, without a separate manual listing step. Bulk Processing Controls • Staff must be able to process groups of returned devices and pre-order fulfilments together, rather than repeating the same steps individually for each one. • Any bulk action must still produce an individual, auditable record for each device and customer affected, so no returned device or pre-order is lost or merged incorrectly within a batch. • An error affecting one device or customer within a batch (for example, a failed evaluation) must not block or delay the processing of the rest of the batch.
Expected Outcome	• Every eligible customer receives a personalized email inviting them to pre-order, sent in bulk but reflecting each customer's own device and exchange eligibility. • Eligible Open Agreement customers can pre-order the iPhone 18 ahead of launch, with eligibility terms shown clearly. • Store staff can fulfil a high volume of pre-order pickups and returned devices on launch day using batch processing rather than handling each one as a separate manual transaction. • Returned devices are evaluated, and approved devices have all ties to the previous customer fully removed before being resold.

	• Approved devices are assigned a depreciation classification and automatically appear as used stock in retail stores. • Devices that fail evaluation are excluded from resale and routed to disposal rather than re-entering stock. • Bulk processing of pre-orders and returned devices produces a complete, traceable record per customer and device, even when handled in batches.
Business Value	• Increases upgrade rates and customer loyalty by making it easy for existing device-subscription customers to move to the newest device. • Recovers value from returned devices through a controlled resale channel, instead of writing them off. • Reduces the risk of reselling a device that is still linked to a previous customer's account or services. • Enables LMT to handle a major product launch surge without overwhelming store staff or slowing down customer service.
Needed Entities	• Customer's Open Agreement record (device, start date, status, linked services). • Product catalog covering both new (iPhone 18) and used device categories. • Pre-order record linking the customer, device model, and trade-in commitment. • Device record and its ownership, agreement, and linked service history. • Device condition evaluation and depreciation classification record. • Store inventory for new and used stock, by location. • Bulk / batch processing capability for pre-order fulfilment and returned device. • Bulk, personalized customer communication capability (e.g., email) for eligibility and pre-order invitations.

B2C-API-011 - Non-resident customer onboarding & eSIM activation (self service)

Type: API **Segment:** B2C

Persona	Amelie — International Student / New Non-Resident Customer . Amelie is a Swiss exchange student arriving in Latvia to study and has no prior relationship with LMT - no local bank account, no local proof of address. Shortly before her first day of classes, she visits LMT's self-care web platform to sign up for mobile service, order an eSIM she can activate immediately on her phone, and choose a plan that covers calls, data, and texting — without visiting a store. Amelie is using her passport and a payment card. Her journey provides the business thread for all API calls demonstrated in this scenario.
Scenario Description	This scenario demonstrates how the BSS solution supports fully self-service digital onboarding of a new, non-resident B2C customer, executed entirely through the calls that a self-care web or mobile application would make behind the scenes. The demonstration should cover: • identity verification, • plan eligibility and selection, • order placement and payment, • digital SIM (eSIM) issuance and activation, • and visibility of the resulting subscription — all without the customer visiting a store or speaking to a representative. Amelie begins by registering as a new customer on LMT's self care platform. Since she has no local ID document, the platform verifies her identity using her passport rather than a Latvian national ID, checking it against an external identity-verification service before her account is confirmed. Because she has no local bank account, her billing method is set up as card payment. Once identified, Amelie browses LMT's plans and is shown a bundle designed for residents who also need to keep in touch abroad. The platform checks whether she is eligible for this plan based on her verified identity and residency status, she selects it, is shown the final price, and completes the order by paying with her card. If the payment fails, she is clearly told so and the order does not proceed. After the order is confirmed, the platform issues Amelie a digital eSIM rather than a physical card, and returns everything she needs to install it on her phone — such as an activation code — directly through the self-care platform. Her subscription is then activated for calls, texts and data, and a phone number is assigned to her. Amelie receives confirmation of her order and instructions for activating her eSIM by email or SMS, having first agreed to LMT's terms and privacy conditions during sign-up. Once activated, she

	can immediately see her active plan and subscription status in her self-care account, and this information is never visible to any other customer. The demonstration is executed live through the Tenderer's API layer (e.g. shown in Postman or Swagger), reflecting exactly what a self-care front-end would call. Where a step depends on an external system not available in the demonstration environment — such as an identity-verification provider or an eSIM-issuing platform — the tenderer may simulate the call, provided this is clearly identified as a simulation.
Product / Bundle	Bundle name: Switzerland Connect Plan. Includes: a digital eSIM (no physical card) and a mobile subscription providing unlimited calls, texts and mobile data within Latvia, plus 60 free minutes per month for calls to Switzerland. Designed for a non-resident customer without local credit history, using card payment as the billing method.
Business Rules	Identity & Onboarding • A new customer must be able to register using a passport rather than a Latvian national ID, providing nationality, date of birth and country of residence. • Identity must be checked against an external verification service before the account is confirmed; the result (pass / fail / needs manual review) must be visible to the platform. • The platform must detect and reject a duplicate registration using the same passport number, with a clear explanation rather than a generic failure. • A billing account must be created for the new customer, supporting card payment as a non-resident-friendly billing method. Plan Eligibility & Selection • The Switzerland Connect Plan must be visible in the catalog with its price and included allowances clearly stated. • Eligibility for the plan must be checked automatically based on the customer's verified identity and residency status, with a clear reason given if the customer does not qualify. Order & Payment • The customer must be able to place an order for the eSIM and plan and see the final price before paying. • Card payment must be captured as part of the order; a declined or failed payment must be clearly reported and must stop the order from proceeding. eSIM Issuance

	• Once the order is confirmed, the platform must issue a digital eSIM profile and provide the customer everything needed to install it on their phone (e.g. an activation code), without requiring physical delivery. • The issuance of the eSIM must automatically update the customer's account status, so other parts of the platform (such as the self-care view) reflect it without manual work. Service Activation • Once installed, the customer's calls, texts and data must be activated, and a phone number assigned. • The plan's specific allowances — unlimited use in Latvia and 60 minutes to Switzerland — must be correctly applied from the moment of activation. Consent & Communication • The customer must agree to LMT's terms and privacy conditions before the order can be completed; an order without this agreement must be rejected. • The customer is offered to accept relevant consents. • Order confirmation and activation instructions must be sent to the customer by email or SMS, with confirmation that they were delivered. Self-Care Visibility • Once active, the customer must be able to see their current plan, subscription status and usage in their self-care account. • A customer must only ever be able to see their own account information, never another customer's.
Expected Outcome	• A new non-resident customer can register, verify their identity by passport, and be onboarded entirely without a store visit or local ID. • The customer can check plan eligibility, place an order, and pay by card, with failed payments clearly rejected. • A digital eSIM is issued and activated without physical delivery, with calls, texts and data working immediately — including the Latvia allowance and the 60 minutes to Switzerland. • Required consents are enforced before the order completes, and confirmation and activation instructions reach the customer. • The customer can immediately see their active plan and status in their self-care account, with access limited to their own data.

Business Value	• Enables fully self-service acquisition of non-resident customers (students, expatriates and similar segments) without a store visit or local documentation.
-----------------------	---

	• Shortens time-to-first-use from days to minutes through digital eSIM delivery. • Reduces manual back-office work and support contacts through automated identity checks, consent handling and status visibility. • Builds early customer trust through transparent pricing, clear payment outcomes and instant account visibility.
Needed Entities	• Customer identity and billing account records, supporting passport-based identity and card payment. • Product catalog entry for the Switzerland Connect Plan, with pricing and eligibility rules. • Order and payment record for the eSIM and subscription. • Digital eSIM issuance and activation record, linked to the customer's subscription. • Consent and notification records for terms, privacy, and order/activation communications. • Self-care account view showing the customer's active plan and status. • External identity verification service (live or simulated) — for demonstration purposes.

5. B2B Scenarios

B2B-E2E-006 - Business User Experience: Sales Team Lead & Account Manager

Type: E2E Functionality **Segment:** B2B

Persona	Anna is a B2B Sales Team Lead responsible for monitoring sales performance, managing sales activities, prioritizing opportunities, and assigning leads to her team. Sofia is a B2B Key Account Manager responsible for managing a portfolio of corporate customers, developing customer relationships, managing sales opportunities, and coordinating collaboration with product, solution, and technical experts.
Scenario Description	This scenario focuses on the day-to-day user experience of two primary B2B business users: Sales Team Lead and Key Account Manager. The objective is to demonstrate how easily users can

	access information, prioritize work, navigate the system, manage their portfolio, and perform daily sales activities from their primary workspace. Primary Evaluation Focus: User Experience (UX), navigation efficiency, information accessibility, and daily productivity of Sales Team Leads and Account Managers. 1. Sales Team Lead's Start of Day Anna opens the Sales Management Dashboard. The demonstration should show: • sales pipeline overview (Next best offer (= max potential) → Lead → Opportunity → Quote → Contract → Order); • Kanban board (Lead → Opportunity → Quote → Contract → Order); • revenue forecast; • team activities; • conversion metrics; • ability to create and modify dashboards without IT involvement. 2. Lead Assignment Anna filters customers for whom the Next Best Offer is Smart Cash Register. Anna selects 50 customers, creates 50 leads and distributes them among five sales representatives, assigning 10 leads to each team member. 3. Account Manager's Start of Day Sofia opens the system and accesses her personalized workspace. The demonstration should show: • customer portfolio overview; • opportunities requiring attention; • today's planned activities and tasks; • overdue tasks; • AI-generated recommendations. 4. Customer Search, Segmentation and Customer 360 Sofia opens the customer list and filters customers using a combination of: • customer segment; • territory;
--	--

	• account manager. Sofia opens the customer account AlphaConsult SIA. The demonstration should show a Customer 360 view containing: • company master data (name, registration number, address); • assigned employees (Account Manager, Support Specialist); • billing overview with 12-month invoice trend; • public registry information (industry, turnover, employee count, risk class, sanctions indicator); • customer segmentation attributes (e.g., current revenue segment, potential revenue segment); • contract overview (active, pending signature, terminated); • product and service overview, including products purchased during the last 3 months; • Next Best Action recommendations, including cross-sell and up-sell opportunities; • customer communications across channels (calls, emails, meetings and other interactions), including last interaction date and communication frequency over the last 12 months; • planned customer activities; • representatives and contacts, including representation rights, roles, email addresses, phone numbers, content subscriptions (e.g., webinars) and consents; • sales opportunities across the lifecycle (Lead → Opportunity → Quote → Contract → Order), with filtering capabilities; • tasks, service requests and incidents related to the customer, with filtering capabilities; • customer health indicators, including customer satisfaction score and churn risk; • AI-generated customer summary based on structured data and free-text interaction notes across the platform.
Product / Bundle	N/A
Business Rules	• Sales Team Lead and Account Manager must be able to perform daily activities from a single workspace with minimal navigation.

	• Customer portfolio, opportunities, tasks, and activities must be searchable and filterable using business attributes (e.g., segment, territory, account manager). • Customer 360 must provide a consolidated customer view by combining information from multiple data sources into a single screen. • Leads, Opportunities and Quotes must be available in both list and Kanban views, while Contracts and Orders must be visible as part of the same sales lifecycle, including status, owner, priority and next activity. • AI-generated recommendations and customer summaries must include an explanation of the underlying rationale and supporting signals.
Expected Outcome	• Sales Team Lead can monitor team activities and sales performance in real time. • Account Manager can start daily work from a single workspace. • Customer 360 provides a comprehensive customer view in a single screen. • The platform supports effective prioritization of customers, opportunities and activities. • AI provides actionable recommendations together with clear business justification.
Business Value	• Enables Sales Team Leads and Account Managers to complete daily sales and customer management activities from a unified and intuitive workspace with minimal navigation between screens. • Frequently used information is available within one or two clicks. • Customer health, opportunities, tasks and recommendations are presented in a clear and actionable way. • The demonstration clearly illustrates the usability and effectiveness of the platform for non-technical business users.
Needed Entities	• Customer (Legal Entity) • Customer Representative • Customer Segment • Lead • Opportunity • Quote

	• Contract • Order • Product • Service • Task • Activity / Interaction • Incident • Service Request • Invoice • Consent
--	--

B2B-E2E-007 - Sales Commission: Approved Deal → Commission Calculation Initiation / Handoff

Type: E2E Functionality Segment: B2B	
Persona	Rihards fulfills the role of a Commission Payee who records commission-relevant inputs on the deal (execution period, split %, required fields), reviews his own next-day calculated commissions, and if needed submits a manual commission approval request (unique deals) or a commission correction request (errors). Ilze fulfills the role of a Commission Approver who reviews and approves manually calculated commissions for unique/non standard deals, with approvals restricted to authorized roles and captured via the defined approval task flow. Andris fulfills the role of a Team Lead who can see team commissions, validate correctness, and approves correction requests within the defined deadlines/escalation chain. Vilnis fulfills the role of a Commission Rules & Data Steward who configures and maintains the system's commission calculation setup and eligibility controls, so commissions are calculated according to the approved rules, and updates the configuration whenever the commission rules change.
Scenario Description	This scenario demonstrates how the CRM platform supports end-to-end B2B sales commission processing from an approved deal and service activation through rule-based calculation, exception handling, and monthly payout handoff - ensuring that commissions are calculated consistently according to the

approved commission rules and that employees have transparent visibility of their commission status. The demonstration should cover:

- Deal inputs and commission eligibility: After a qualifying sales outcome (e.g., service activation), **Rihards** records commission-relevant inputs on the deal — execution period, split percentages, and any required fields — so the commission engine can use them during calculation and status tracking. **Vilnis** has previously configured the commission rules, eligibility controls, and field definitions in the platform; **Rihards** works within the structure **Vilnis** has set up, entering only the inputs the rule set requires.
- Daily commission calculation for standard cases: An automated daily run calculates commissions according to the approved rule set configured by **Vilnis**, and publishes results the next day. **Rihards** reviews his calculated commissions in his personal commission view - seeing the outcome for each qualifying deal without needing to request a report or contact the back office.
- Unique / non-standard deals (manual path): When a deal requires a manual commission calculation outside the standard rule set, **Rihards** submits a manual commission approval request directly from the deal record. **Ize** receives the approval task, reviews the manual calculation within her authorised scope, and approves or rejects it. The approved result is published back as a calculated commission outcome and becomes visible to **Rihards** in his commission view.
- Error handling and corrections (exception path): If **Rihards** detects an error in a calculated commission within the defined correction window, he submits a commission correction request. **Andris** receives the correction request as the team lead, validates the correction against the deal data and commission rules, and approves it within the defined escalation chain and deadline. The approved correction is published back so **Rihards** sees the updated commission status immediately.
- Team visibility and validation: **Andris** has visibility into team level commission results — not only individual correction requests — allowing him to validate overall correctness across his team before the monthly payout cutoff and to identify systematic issues that may require **Vilnis** to review the commission rule configuration.
- Commission rule maintenance: **Vilnis** monitors the commission calculation setup throughout the period and

	updates the configuration whenever commission rules change, for example, when new product commission rates are approved or eligibility conditions are revised. Rule changes are versioned and take effect from the configured date without requiring IT involvement. • Monthly payout preparation and reconciliation: At period end, the platform prepares the payable commission set for monthly payout. Andris performs the team-level review and sign-off within the platform before the handoff to payroll. Any corrections applied by the payroll system after handoff are reflected back into the platform so Rihards sees an up-to date and accurate commission status at all times.
Product / Bundle	Commissionable B2B products/services and devices (as per approved commission rules)
Business Rules	Eligibility: • Commissions are calculated only for commissionable B2B products/services/devices as defined in the approved commission rule set (eligible lists, coefficients, and calculation logic). Constraints and dependencies: • Deal must capture the required commission inputs as structured fields (e.g., execution period, split %, and other mandatory inputs used by the calculation). • Daily (next-day) commission calculation: for qualifying standard cases, commissions are calculated on a daily cycle according to the approved rule set, with results visible to employees within one business day. • Monthly Payout Controls & Approvals: The solution must support monthly payout preparation and required controls/approvals, including deadline-driven review and approval steps. Commissions: • Each deal must show a clearly visible commission status (for example: calculated, included in a payout run, paid) that updates automatically as calculation and payout progress. • Unique / Non-standard Deals - if the deal is unique / non-standard (e.g., pilot/implementation stage service, bespoke solution, unique transaction), commission is handled

	via a dedicated manual approval workflow before the result is published. • Corrections (error handling + deadline) - if an error is detected, a Commission correction request must be raised and routed through the defined approval chain; corrections must be completed within the defined correction window. • Commission rules and eligibility controls must be configurable and maintained in the system so commissions are always calculated according to the approved rules; when the commission model/rules change, the configuration must be updated accordingly with controlled access.
Expected Outcome	• Commissions for qualifying B2B activations are calculated automatically on a daily basis, with results visible to employees - and to managers for their teams - within one business day. • The deal contains the required commission input fields (e.g., execution period, split %) and the platform uses these structured inputs in the calculation and tracking flow. • Unique / non-standard deals are handled through a manual commission approval workflow, and once approved, the result is published back so it appears in the employee's commission overview. • Users can see how a deal's commission status progresses (for example: calculated, included in a payout run, paid), with updates aligned to calculation and payout progress. • Commission corrections can be submitted and routed through the defined approval chain, and approved corrections are reflected in the results within the correction window. • Monthly payout preparation supports deadline-driven controls and approvals. Payout execution handoff is supported with traceable steps. • The commission calculation setup and eligibility controls are maintained in the system so calculations follow the approved rules, and when rules change, configuration can be updated accordingly under governed access.
Business Value	• Faster, more motivating feedback loop: Next-day visibility of calculated commissions brings results closer to compensation, improving motivation and focus on execution.

	• Business agility in incentives: A configurable and governed commission ruleset allows LMT to shift incentive emphasis where needed (products/channels/periods) without heavy rework, supporting alignment with business goals. • Less manual work, fewer errors and disputes: A unified, automated commission process reduces manual calculations and special-case handling, improving accuracy and lowering correction effort. • Transparency and trust: Employees gain clear, traceable status and progress from calculation to payout, strengthening confidence in the commission model and reducing escalations. • Stronger governance & compliance for payouts: Built-in controls/approvals and structured payout preparation support timely and compliant payments with clear auditability.
Needed Entities	• Users can see how a deal's commission status progresses (for example: calculated, included in a payout run, paid), with updates aligned to calculation and payout progress. • Sales Activation Record (qualifying sales outcome / activation event) that triggers commission creation and/or update. • Commission Rule Set (approved rules + eligibility controls + allocation/split logic) used by the calculation run and maintained as governed configuration. • B2B Sales Commission record (commission entitlement/result) with lifecycle states and auditability, including handling of standard vs. non-standard deals and corrections. • Commission Approval & Correction tasks to support non standard (manual) commissions and error correction flows (e.g., "Commission approval and "Commission correction), including the approval chain and evidences/attachments for manual calculations. • Employee / Payee entity (commission recipient) and related visibility scope (employee sees own commissions; managers can review team commissions as applicable), with PII handling where relevant. • Monthly payout set / control list + approvals supporting payout preparation, compliance checks, approval routing and handoff into the payroll execution process (incl. deadline-driven approvals).

B2B-E2E-008 - Data-Driven Campaign Management & Sales Follow-Up

Type: E2E Functionality **Segment:** B2B

32

CONFIDENTIAL

Persona	Mark is a Campaign Manager responsible for planning, launching, monitoring, and optimizing B2B campaigns, including audience selection, campaign performance tracking, funnel analysis, pipeline monitoring, and campaign result optimization. Sofia is a Key Account Manager responsible for following up campaign leads, engaging customers, and converting campaign responses into opportunities and sales.
----------------	--

Scenario Description	This scenario demonstrates how the platform supports end-to-end B2B campaign management, from customer selection and campaign execution to sales follow-up, opportunity creation, and performance analysis. The campaign targets customers whose Next Best Offer (NBO) is <i>Smart Cash Register</i>. Campaign audiences are built using CRM, billing, and external business data. Primary Evaluation Focus: Campaign Management, Next Best Offer (NBO), Customer Segmentation, Campaign Automation, Sales Follow-Up, Campaign Performance Analytics, and AI Assisted Optimization. 1. Campaign Preparation Mark creates a new campaign for the <i>Smart Cash Register</i> product. The demonstration should show: • creation of a campaign based on customers whose Next Best Offer (NBO) is Smart Cash Register; • segmentation of the target audience using customer segment, billing data, CRM data, and external business data; • AI-generated audience recommendations and campaign suggestions; • definition of campaign goals, success metrics, and target audience; • configuration of campaign offers, communication channels, and customer journey; • configuration of a trigger-based campaign where customers who register for or attend a Smart Cash Register webinar automatically receive follow-up communications and sales tasks. 2. Campaign Execution
-----------------------------	---

Mark launches the campaign and monitors customer engagement.

The demonstration should show:

- personalized email campaigns;
- personalized self-service (MansLMT) banners;
- webinar and event invitations;
- customer engagement tracking (emails sent, opened, clicked);
- webinar registrations and attendance tracking;
- customer journey progression based on customer behaviour;
- AI recommendations for campaign optimization based on customer engagement and campaign performance.

3. Sales Follow-Up

Sofia receives and processes campaign-generated sales leads. The demonstration should show:

- automatic lead creation based on campaign responses;
- follow-up activities for customers who opened emails, clicked links, attended webinars, or participated in events;
- conversion of campaign responses (leads) into opportunities;
- Customer 360 view showing Next Best Offer recommendations, campaign participation history, and campaign-related customer interactions across channels.

4. Campaign Monitoring and Optimization

Mark monitors campaign and sales performance.

The demonstration should show:

- campaign funnel overview;
- pipeline progression from target audience to opportunity, offer, won, and lost stages;
- conversion analysis by campaign, product, segment, channel, and sales team;
- actual versus target performance monitoring;
- analysis of customer needs and rejection reasons;
- identification of opportunities to improve future campaigns and NBO recommendations;
- AI-generated insights explaining campaign performance, customer needs, conversion drivers, and rejection patterns;

	• AI recommendations for future campaigns, customer segments, and Next Best Offer improvements.
Product / Bundle	Smart Cash Register (https://www.lmt.lv/en/business/cash-register)
Business Rules	• Campaign audiences must be based on customer segmentation and Next Best Offer recommendations. • Customer interactions and campaign history must be available in Customer 360. • Campaign engagement can automatically trigger follow-up sales activities. • Campaign responses must be traceable throughout the sales pipeline. • Campaign performance must be measured by campaign, segment, product, and channel.
Expected Outcome	• Campaigns can be created and executed using customer segmentation and Next Best Offer recommendations. • Customer engagement automatically drives follow-up sales activities. • Campaign responses can be converted into leads, opportunities, and sales. • Customer 360 provides a complete view of campaign related customer information. • Campaign performance is measurable across the entire sales funnel. • Business users can optimize future campaigns based on campaign results and customer behavior.
Business Value	• Improves campaign targeting through data-driven customer selection and Next Best Offer recommendations. • Increase conversion of campaign responses into sales opportunities. • Reduces manual effort through automated follow-up activities. • Provides end-to-end visibility of campaign effectiveness and sales outcomes. • Enables continuous optimization of campaigns based on customer behavior and business results.
Needed Entities	• Campaign • Customer (Legal Entity)

	• Customer Representative • Consent • Next Best Offer • Product / Bundle • Lead • Opportunity • Customer Segment • Campaign Activity
--	---

B2B-E2E-009 - Incident & Problem Management with AI-Assisted Root Cause Analysis

Type: E2E Functionality Segment: B2B	
Persona	Emma is a Level 1 Support Specialist responsible for incident registration, initial classification, prioritization, basic diagnostics, and escalation to Level 2 when required. Oliver is a Level 2 Support Specialist responsible for advanced diagnostics, incident investigation, problem identification, and escalation to Level 3 when required. Linda is a Level 3 External Partner Specialist responsible for incident resolution and technical support. Gunnar is a Level 4 Problem Manager responsible for root cause analysis, permanent resolution, and Problem Management.
Scenario Description	This scenario focuses on the end-to-end lifecycle of Complaint, Incident and Problem Management, including AI-assisted categorization, SLA management, external partner collaboration, incident correlation, and root cause analysis. Primary Evaluation Focus: Complaint Management, Problem Management, SLA Management, Incident Correlation, AI powered Problem Detection, AI-assisted Root Cause Analysis, and cross-functional collaboration. 1. Complaint Registration and Initial Assessment Emma receives a complaint from a customer representative who is registered as a Smart Cash Register Administrator. The demonstration should show: • customer search and Customer 360 access;

- visibility of company representatives, roles, and representation rights;
- identification of the representative who submitted the complaint;
- complaint registration using a checklist-driven approach; • automatic categorization, prioritization, and assignment based on checklist responses;
- AI recommendations for category, priority, and responsible team;
- ability for Emma to manually override AI recommendations; • complaint and incident history for the customer.

Emma determines that the issue cannot be resolved at Level 1 and escalates it to **Oliver**.

2. Investigation, SLA Validation and External Partner Escalation

Oliver reviews the complaint and customer context. The demonstration should show:

- customer products and services;
- SLA terms and support level defined in the customer contract;
- active incidents, complaints, and service requests;
- AI recommendations for next actions;
- escalation to an external partner when required; **Oliver**

determines that the issue falls within the customer's contracted SLA and requires Level 3 investigation.

The demonstration should show:

- creation of a task for the external partner;
- automatic creation of a Jira ticket;
- linkage between the incident and Jira ticket;
- **Oliver** remaining the owner of the incident while work is performed externally.

3. External Partner Resolution and Synchronization Linda, acting as the external partner, receives the Jira ticket and performs the investigation.

The demonstration should show:

- bidirectional synchronization between Jira and the platform;

- synchronization of status updates, comments, attachments, and resolution details;
- visibility of external partner activities directly from the incident record;
- configurable closure process:
 - automatic incident closure when the Jira ticket is resolved;
 - or manual validation by **Oliver** before incident closure.

4. Customer Communication and Status Visibility The system keeps the customer informed throughout the investigation.

The demonstration should show:

- customer-facing incident status visibility through self service channels;
- automated notifications and updates;
- complete communication history associated with the incident;
- visibility of communications originating from integrated systems, including Jira;
- audit trail of all customer communications.

5. Recurring Issue Detection and Incident Correlation The system identifies that multiple customers have reported similar issues.

The demonstration should show:

- identification of similar incidents and complaints;
- AI-assisted incident correlation;
- grouping of related incidents under a common Problem record;
- visibility of affected customers, products, and services;
- trend analysis and reporting;
- creation of a Problem record from multiple incidents. The

demonstration should also show that when a new incident is registered and appears related to an existing Problem, the system automatically alerts the user and recommends linking the incident to the existing Problem.

6. Problem Investigation and Root Cause Analysis Gunnar, acting as a Level 4 specialist, investigates the Problem record.

	The demonstration should show: • consolidated view of all incidents linked to the Problem; • analysis at Problem level instead of reviewing incidents individually; • AI-assisted identification of common patterns across incidents; • AI-generated root cause hypotheses; • supporting evidence and rationale for AI recommendations; • ability to confirm, reject, or refine AI suggestions; • creation of corrective actions and permanent resolution activities. The objective is to demonstrate how AI helps identify recurring issues faster, supports root cause analysis, and reduces manual effort required to investigate large numbers of related incidents. 7. KPI Monitoring and Reporting The demonstration should show: • response time, triage time, resolution time, and SLA compliance; • first contact resolution, escalation rate, and reopened incidents; • affected customers and recurring issue trends; • incidents linked to a Problem record; • AI insights for recurring issue detection and root cause analysis; • drill-down from KPI dashboards to underlying incidents and Problems.
Product / Bundle	Smart Cash Register https://www.lmt.lv/en/business/cash_register

Business Rules	• AI and business rules should suggest complaint category, priority, and assignment. • Users must be able to override system recommendations. • Customer representatives, roles, products, services, and SLA information must be available in a single customer view. • Incident ownership must remain with the assigned internal specialist, even when work is performed by an external partner.
-----------------------	--

	• Jira activities, statuses, comments, and attachments must be synchronized with the platform. • Customers must be able to track incident status through self-service or notifications. • The platform must identify similar incidents and recommend linking them to an existing Problem record. • AI should assist with incident correlation and root cause analysis. • Problems, incidents, and corrective actions must be linked and traceable. • SLA targets and KPI measurements must be configurable at product, customer segment, and customer level. • The platform must provide KPI reporting and drill-down capabilities for incidents and Problems.
--	--

Expected Outcome	• Complaints are categorized, prioritized, and assigned with AI assistance and minimal manual effort. • Customer representatives, products, services, and SLA information are accessible from a single customer view. • Incidents can be efficiently escalated and managed across internal teams and external partners. • Jira and the platform operate as a unified workflow with synchronized statuses, comments, and activities. • Customers can track incident progress through self-service channels and notifications. • Similar incidents are automatically identified and linked to Problem records. • AI helps identify recurring issues and supports root cause analysis. • Problem records provide visibility of affected customers, incidents, services, and corrective actions. • SLA and operational KPIs are measurable and available through dashboards and reports. • Users can analyze recurring issues, affected customers, and Problem trends. • The solution demonstrates bi-directional integration with an external ticketing system (e.g., Jira) for incident and problem records. Where a live connection to Jira is not available in the demonstration environment, the tenderer may simulate the integration by showing the relevant API calls and responses (request payloads, status codes, returned ticket IDs, and status-change payloads), clearly identifying which parts are simulated.
-------------------------	--

Business Value	• Faster complaint resolution through automation, AI recommendations, and SLA-driven workflows. • Improved visibility of customer issues, ownership, and resolution progress. • Efficient collaboration between internal teams and external partners within a unified process. • Reduced manual effort through incident correlation, automatic Problem creation, and system integrations. • Faster identification of recurring issues and root causes through AI-assisted analysis. • Improved service quality by addressing underlying problems, not only individual incidents. • Improved SLA monitoring and operational performance visibility. • Better decision-making through KPI reporting and trend analysis.
Needed Entities	• Customer • Customer Representative • Complaint • Incident • Problem • SLA • Product • Service • Contract • Change Request

B2B-API-010 - B2B Ecosystem Integration: From Customer Onboarding to Operations

Type: API Segment: B2B	
Persona	Janis — BSS Integration Architect (LMT) Jānis evaluates whether the vendor's BSS platform can integrate reliably with LMT's existing and planned ecosystem. Using Postman or Swagger he executes live API calls to verify that each integration point works correctly, returns well-formed responses, and conforms to TM Forum Open API standards.

	Anna — B2B Sales Agent (business context) Anna's workflow — onboarding a new B2B customer, placing a product order, and activating services — provides the business thread for all API calls demonstrated. Every integration domain maps to a step Anna would perform or depend on in a real sales and delivery cycle.
Scenario Description	This scenario demonstrates how the BSS platform integrates with the key external systems required to run B2B operations end-to end. The demonstration uses a single business thread — onboarding AlphaConsult SIA, a 12-employee logistics company, and delivering a Managed Connectivity bundle — so each API call has clear business meaning. The demonstration is executed live in Postman or Swagger. For each integration domain the vendor must show a working API call with a real request and response. Where the integration is event driven, a webhook must receive a live notification during the session. The seven integration domains are: 1. Legal Entity Data Ingestion / Validation from Registers + Enrichment 2. Billing System Integration (Billing Unit, Service Activation, Pricing / Products) 3. Warehouse / E-Shop / Logistics Integration (Device Ordering, Delivery, Returns) 4. Outsourcing / Partner Integration with CRM and Incident Management Systems 5. Consent & Communication Notifications (Email / SMS) + Consent Enforcement for NBO / Campaigns 6. Export to Analytics / Reporting (Funnel, Activities, Portfolios) 7. Self-Service Portal Integration (User Import, Roles, Product Administration)
Product / Bundle	Managed Connectivity + Device-as-a-Service (DaaS) Includes: unlimited mobile voice and data subscription (employee lines), FWA business internet (site-level), and a laptop on a 36- month DaaS subscription. These products provide the context for catalog retrieval, order placement, billing unit creation, device ordering, and portal product administration API calls throughout the demonstration.

Business Rules	1. Legal Entity Data Ingestion (TMF632) • A new legal entity must be creatable via POST /party — accepting company name, registration number, legal address, and representative, returning 201 Created. • The platform must support enrichment from an external business register — a configurable mechanism must allow externally validated company data to be ingested or linked without re-entry. • Duplicate detection must be enforced — a second POST with the same registration number must return a structured error with a machine-readable code, not a generic failure. • Incremental data updates must be supported via PATCH /party/{id} — external register refresh jobs must be able to update specific fields without overwriting the full record. • Party creation and update events must be published as webhook notifications — Jānis must receive a live partyCreateEvent on a registered endpoint during the demonstration. 2. Billing System Integration (TMF666, TMF620, TMF641) • A billing account linked to AlphaConsult SIA must be retrievable or creatable via TMF666 — the response must include the billing account structure, payment method, and billing cycle. • Product pricing must be accessible to external billing systems via TMF620 — a GET /productOffering call must return the pricing model (recurring fee, one-time charge, discounts) in a machine-readable format. • Service activation must be triggerable via POST /serviceOrder (TMF641) — the response must confirm the service order ID and initial activation state. • When an order moves to activated state, the platform must publish a state change event (productOrderStateChangeEvent via TMF622) — an external billing system must be able to consume this event to trigger invoicing without polling. • Billing unit creation — linking customer, product, and billing account — must be demonstrable via API, confirming the first billing cycle is scheduled. 3. Warehouse / Logistics Integration (TMF622, TMF637) • A device order for the DaaS laptop must be placeable via POST /productOrder (TMF622) — the response must confirm order ID, line items, and initial fulfilment state
-----------------------	--

- Order state lifecycle events must be published as the order progresses — Jānis must receive at least one live productOrderStateChangeEvent on a webhook during the demonstration
- Device availability or stock status must be checkable via TMF637 — a GET /productInventory call must return the result consumed from or linked to an external warehouse system
- A device return or replacement must be initiatable via API — either a PATCH on an existing order or a new return order, producing the correct state and billing adjustment trigger
- Logistics events (shipped, delivered, returned) must be ingestible by the platform via a standardised endpoint — the vendor must show the expected payload structure and confirm the platform processes it correctly.

4. Partner / Outsourcing Integration (TMF621, TMF629)

- An incident linked to a customer account must be creatable via POST /troubleTicket (TMF621), and its status retrievable via GET — confirming an external service desk can create and track incidents via API.
- Ticket state change events must be published as webhook notifications — an external partner system must be able to receive status updates without polling the BSS.
- Customer and account context must be retrievable by external partners via TMF629 GET /customer/{id} — returning the customer profile, active products, and account manager to enrich incident records.
- Partner systems must be access-controlled by token scope — a partner-scoped token must only return the resources permitted for that partner role, not full BSS data.
- Ticket escalation to an external resolver must be demonstrable via API — a PATCH or dedicated endpoint must allow assignment to an external party, with an escalation event published to subscribers.

5. Consent & Notifications (TMF644)

- Current consent status per channel and purpose must be retrievable via GET /privacyProfile/{partyId} and updatable via PATCH — external channels must be able to read and enforce consent without BSS UI access.
- Consent must be enforced before sending any outbound message — a notification POST for a customer who has withdrawn SMS consent must return a structured 4xx rejection, not silent suppression.

- Outbound email or SMS notifications must be triggerable via API — the payload must specify customer reference, channel, template, and variable content, without the caller needing its own delivery infrastructure.
- Consent changes must be published as webhook events — allowing the NBO engine and campaigns to immediately reflect updated preferences without a batch sync.
- Notification delivery status (sent, delivered, opened, bounced) must be trackable via GET — external systems must be able to close the loop on communication outcomes via API.

6. Analytics / Reporting Export

- Sales funnel data (deal stage progression, count, value, conversion rate) must be exportable via API in a structured format — without requiring direct database access.
- Sales activity records (calls, meetings, proposals) must be retrievable per customer, opportunity, or agent — in a format consumable by an external BI tool without custom extraction scripts.
- Customer portfolio data (active products, contract status, SLA entitlements) must be retrievable via API in a machine readable payload usable for account health reporting.
- Business events (order placed, contract signed, campaign converted) must be publishable to an external event bus or analytics platform via webhook — Jānis must confirm a live event is received.
- The analytics export must support filtering by date range, customer segment, product category, and sales owner — so external tools can retrieve targeted data slices without pulling and filtering the full dataset.

7. Self-Service Portal Integration (TMF632, TMF669)

- A portal user account linked to a corporate account must be creatable via POST /partyRole or equivalent — with role assignment (administrator, viewer, end-user) specified in the payload.
- Role updates must be possible via PATCH, and current role assignments for all users within an account must be retrievable via GET — confirming external HR or identity systems can manage user lifecycle without BSS UI access
- Portal product actions (view products, request a change, download invoice) must be backed by the same TM Forum APIs used by other integration consumers — not a portal

	specific internal API.
--	------------------------

	• Access control must be enforced via token scope — a customer-scoped token requesting another customer's data must return 403 Forbidden with a structured error. • Portal session events (login, product viewed, order initiated) must be capturable as interaction records accessible via API — confirming external analytics can consume portal engagement data alongside BSS transaction data.
Expected Outcome	• Live API calls executed in Postman or Swagger for all seven integration domains — real request payloads and valid responses shown for each. • TM Forum Open API conformance confirmed — correct resource paths, HTTP methods, status codes, and response schemas for each demonstrated API. • At least one live webhook notification received per applicable domain — Jānis registers an endpoint and receives a real event payload during the session. • Legal entity creation, duplicate detection, and incremental enrichment all return correct responses via TMF632. • Billing account, product pricing, service activation, and billing event all confirmed via API — state change event received on webhook. • Device order placed, state transition event received, and inventory check returned via TMF637. • Incident created and state change event received — partner scoped token confirmed to restrict access to authorized resources only. • Consent enforcement confirmed — notification for non consenting customer returns structured rejection; consent change event received on webhook. • Sales funnel, activity, and portfolio data returned in a structured, filterable format. • Portal user created with role assignment, role updated via PATCH, cross-account access returns 403 with structured error.

Business Value	• Confirms the BSS platform can connect with LMT's existing ecosystem without bespoke point-to-point connectors — reducing integration cost and delivery risk. • TM Forum Open API compliance protects LMT from vendor lock-in — individual system components can be replaced without rewiring integration layers. • Event-driven integration allows external systems to react to BSS state changes in real time — eliminating batch processing lag and manual synchronization.
-----------------------	---

	• Standardized consent enforcement at the API layer ensures regulatory compliance without relying on individual channel implementations. • B2B self-service portal user and role management via API reduces LMT support overhead for enterprise customer administration. • Analytics export API removes the need for direct database access — enabling faster, lower-risk deployment of LMT's reporting and BI tooling.
--	---

Needed Entities	• TM Forum Open API suite — TMF620 Product Catalog, TMF622 Product Order, TMF629 Customer, TMF632 Party, TMF637 Product Inventory, TMF641 Service Order, TMF644 Privacy, TMF648 Quote, TMF666 Account, TMF678 Bill, TMF683 Party Interaction, TMF621 Trouble Ticket. • Postman collection or Swagger UI — pre-configured with base URL, authentication, and sample payloads for each domain. • Webhook receiver endpoint — externally accessible, registered during the demonstration to capture live event notifications. • B2B customer record (AlphaConsult SIA) — pre-created as the party / legal entity used across all API calls. • Product catalog (Managed Connectivity + DaaS bundle) — pre-configured and retrievable via TMF620. • Billing account — linked to AlphaConsult SIA, demonstrable via TMF666. • Consent profile — pre-seeded with mixed consent states per channel to demonstrate enforcement. • Analytics / reporting endpoint — external stub or live tool configured to receive analytics export events. • Partner / service desk stub — to receive and respond to incident events via TMF621. • Self-service portal user accounts — pre-created with different roles to demonstrate access control via API. • OAuth2 / JWT tokens — scoped per integration role (internal, partner, portal user) — for preview and access control demonstration purposes.
------------------------	---
